5 The invention additionally relates to the preparation of these compounds, compositions containing them and their use for controlling harmful fungi, in particular Botrytis.

10 N-(2-Chlorophenyl)-2-chloronicotinamide is known from the literature as a fungicidal active compound (DE-A 2 417 216).

It is an object of the present invention to provide novel fungicidally active compounds having an improved spectrum of action.

15 We have found that this object is achieved by the compounds I defined at the beginning.

We have additionally found processes for preparing these compounds, compositions containing them and their use for controlling harmful fungi.

20 The compounds I are in general obtained by reacting a carboxylic acid halide of the formula II in a manner known per se (eg. J. March, Advanced Organic Chemistry, 2nd Ed., 1977, 382 ff., McGraw-Hill) with an N-hydroxyaniline of the formula III in the presence of a  
25 base.

The radical Hal in the formula II is a halogen such as chlorine, bromine or iodine, in particular chlorine or bromine.

30 This reaction is customarily carried out at temperatures from  $-20^\circ\text{C}$  to  $100^\circ\text{C}$ , preferably  $-10^\circ\text{C}$  to

50°C.

Suitable solvents are:

aliphatic hydrocarbons such as pentane, hexane, cyclo-  
hexane and petroleum ether, aromatic hydrocarbons such as  
5 toluene, o-, m- and p-xylene, halogenated hydrocarbons  
such as dichloromethane, chloroform and chlorobenzene,  
ethers such as diethyl ether, diisopropyl ether, tert-  
butyl methyl ether, dioxane, anisole and tetrahydrofuran,  
nitriles such as acetonitrile and propionitrile, ketones  
10 such as acetone, methyl ethyl ketone, diethyl ketone and  
tert-butyl methyl ketone, alcohols such as methanol,  
ethanol, n-propanol, isopropanol, n-butanol and tert-  
butanol, and also dimethyl sulfoxide and dimethyl-  
formamide, particularly preferably toluene, xylene and  
15 tetrahydrofuran.

Mixtures of the solvents mentioned can also be  
used.

Suitable bases are generally inorganic compounds  
such as alkali metal and alkaline earth metal hydroxides  
20 such as lithium hydroxide, sodium hydroxide, potassium  
hydroxide and calcium hydroxide, alkali metal and  
alkaline earth metal oxides such as lithium oxide, sodium  
oxide, calcium oxide and magnesium oxide, alkali metal  
and alkaline earth metal hydrides such as lithium  
25 hydride, sodium hydride, potassium hydride and calcium  
hydride, alkali metal amides such as lithium amide,  
sodium amide and potassium amide, alkali metal and  
alkaline earth metal carbonates such as lithium carbonate  
and calcium carbonate and also alkali metal hydrogen-  
30 carbonates such as sodium hydrogencarbonate, and organo-  
metallic compounds, in particular alkali metal alkyls  
such as methyllithium, butyllithium and phenyllithium,  
alkylmagnesium halides such as methylmagnesium chloride  
and also alkali metal and alkaline earth metal alkoxides  
35 such as sodium methoxide, sodium ethoxide, potassium  
ethoxide, potassium tert-butoxide and dimethoxymagnesium,  
additionally organic bases, eg. tertiary amines such as

trimethylamine, triethylamine, tri-isopropylethylamine and N-methylpiperidine, pyridine, substituted pyridines such as collidine, lutidine and 4-dimethylaminopyridine and also bicyclic amines.

5 Sodium hydrogencarbonate, sodium carbonate, triethylamine and pyridine are particularly preferred.

The bases are in general employed in equimolar amounts based on the compound II. However, they can also be used in an excess of from 5 mol% to 30 mol%,  
10 preferably 5 mol% to 10 mol%, or - in the case of the use of tertiary amines - if appropriate as a solvent.

The starting materials are in general reacted with one another in equimolar amounts. It may be advantageous for the yield to employ II in an excess of from  
15 1 mol% to 20 mol%, preferably 1 mol% to 10 mol%, based on III.

The starting substances of the formulae II and III needed for preparing the compounds I are known in the literature (Houben-Weyl, Methoden der org. Chemie  
20 (Methods of Organic Chemistry), Vol. 10/1, pp. 1138-1148) or can be prepared according to the literature cited.

The novel active ingredients are particularly suitable for protecting various materials against degradation or destruction by bacteria or fungi or from being attacked by and covered with microorganisms. Examples of materials which can be preserved or microbically finished with the novel active ingredients are glues and adhesives, starch solutions, wax emulsions, clay emulsions, sizes, finishes, spinning baths, gelatine formulations, putty, joint sealants, cooling lubricants, drilling oils, fuels, plastic dispersions, emulsion paints, textiles, leather, raw hides and cosmetics. The compounds are also suitable as anti-slime agents in the paper industry, in cooling towers and in air moistening units.

The compounds I are also suitable for protecting the following plant species against attack by microorganisms:

cereals (e.g., wheat, barley, rye, oats, rice, sorghum and related species); beets (e.g., sugar and fodder beets); pomes, drupes and aggregate fruit (e.g., apples, pears, plums, peaches, almonds, cherries, strawberries, raspberries and blackberries); legumes (e.g., beans, lentils, peas, soybeans); oil-yielding crops (e.g., rape, mustard, poppies, olives, sunflowers, coconuts, castor-oil beans, cocoa beans, groundnuts); cucurbits (e.g., pumpkins, cucumbers, melons); fiber-yielding plants (e.g., cotton, flax, hemp, jute); citrus fruit (e.g., oranges, lemons, grapefruit, tangerines); vegetables (e.g., spinach, lettuce, asparagus, cabbage varieties, carrots, onions, tomatoes, potatoes, paprika); laurel species (e.g., avocado, cinnamomum, camphor) or plants such as Indian corn, tobacco, nuts, coffee, sugar cane, tea, grapes, hops, and banana and rubber trees. For the purposes of the present invention, the term "plants" is also taken to mean all types of other green growth, whether ornamentals, grassy areas, embankments, or generally low-growing cover crops.

For example the following microorganisms may be combatted with the novel compounds I:

*Straphylococcus aureus*, *Escherichia coli*, *Klebsiella pneumoniae*, *Citrobacter freundii*, *Proteus vulgaris*, *Pseudomonas aeruginosa*, *Desulfovibrio desulfuricans*, *Streptovorticillium rubroreticuli*, *Aspergillus niger*, *Aspergillus versicolor*, *Penicillium funiculosum*, *Penicillium expansum*, *Penicillium glaucum*, *Paecilomyces variotii*, *Trichoderma viride*, *Chaetomium globosum*, *Aspergillus amstelodami*, *Phoma pigmentovora*, *Phoma violacea*, *Aureobasidium pullulans*, *Saccharomyces cerevisiae*, *Alternaria tenuis*, *Stemphylium macrosporoideum*, *Cladosporium herbarum*, *Cladosporium resinae*, *Candida albicans*, *Trichophyton mentagrophytes*, *Geotrichum candi-*

dans, *Monilia sitophila*, *Scenedesmus quadricauda*, *Chlorella vulgaris*, *Nostoc muscorium*, *Oscillatoria limosa* and *Anabaena constricta*.

- 5 The novel substances can be converted into conventional formulations such as solutions, emulsions, suspensions, dusts, powders, pastes and granules. The application forms depend entirely on the purposes for which they are intended; they should at all events ensure a fine and uniform distribution of the active ingredient.
- 10 The formulations are produced in known manner, for example by extending the active ingredient with solvents and/or carriers, with or without the use of emulsifiers and dispersants; if water is used as solvent, it is also possible to employ other organic solvents as auxiliary solvents. Suitable auxiliaries for this
- 15 purpose are solvents such as aromatics (e.g., xylene), chlorinated aromatics (e.g., chlorobenzenes), paraffins (e.g., crude oil fractions), alcohols (e.g., methanol, butanol), ketones (e.g., cyclohexanone), amines (e.g., ethanolamine, dimethylformamide), and water; carriers such as ground natural-minerals (e.g.,
- 20 kaolins, aluminas, talc and chalk) and ground synthetic minerals (e.g., highly disperse silica and silicates); emulsifiers such as nonionic and anionic emulsifiers (e.g., polyoxyethylene fatty alcohol ethers, alkyl sulfonates and aryl sulfonates); and dispersants such as lignin-sulfite waste liquors and methylcellu-
- 25 lose.

The fungicides generally contain from 0.1 to 95, and preferably from 0.5 to 90, wt% of active ingredient. The active ingredients are used in a purity of from 90 to 100, and preferably from 95 to

30 100, % (according to the NMR/HPLC/GC spectrum).

Usual application concentrations are - based on the weight of the material to be protected - from 0.001 to 5, and preferably from 0.01 to 2, wt% of active ingredient; when the active ingredients

35 are used for treating water, in oil production, in drilling and cutting oils, fuels, in swimming baths, cooling towers, air moistening units or in the paper industry, amounts of from 5 to 500 ppm are sufficient. Ready-to-use disinfectant solutions contain for instance from 0.5 to 10wt% of active ingredient.

40

Examples of such formulations are given below:

- I. A solution of 90 parts by weight of compound no. 3 and 10 parts by weight of N-methyl- $\alpha$ -pyrrolidone, which is suitable for
- 45 application in the form of very fine drops.

2106497

37

- II. A mixture of 20 parts by weight of compound no. 4, 80 parts by weight of xylene, 10 parts by weight of the adduct of 8 to 10 moles of ethylene oxide and 1 mole of oleic acid-N-monoethanolamide, 5 parts by weight of the calcium salt of dodecylbenzenesulfonic acid, and 5 parts by weight of the adduct of 40 moles of ethylene oxide and 1 mole of castor oil. By finely dispersing the mixture in 100,000 parts by weight of water, an aqueous dispersion is obtained.
- 10 III. An aqueous dispersion of 20 parts by weight of compound no. 1, 40 parts by weight of cyclohexanone, 30 parts by weight of isobutanol, 20 parts by weight of the adduct of 40 moles of ethylene oxide and 1 mole of castor oil. A mixture of this dispersion with 100,000 parts by weight of water contains 0.02wt% of  
15 the active ingredient.
- IV. An aqueous dispersion of 20 parts by weight of compound no. 3, 25 parts by weight of cyclohexanol, 65 parts by weight of a mineral oil fraction having a boiling point between 210 and 280°C,  
20 and 10 parts by weight of the adduct of 40 moles of ethylene oxide and 1 mole of castor oil. The mixture of this dispersion with 100,000 parts by weight of water contains 0.02wt% of the active ingredient.
- 25 V. A hammer-milled mixture of 80 parts by weight of compound no. 2, 3 parts by weight of the sodium salt of diisobutyl-naphthalene- $\alpha$ -sulfonic acid, 10 parts by weight of the sodium salt of a lignin-sulfonic acid obtained from a sulfite waste liquor, and 7 parts by weight of powdered silica gel. By finely dispersing the  
30 mixture in 20,000 parts by weight of water, a spray liquor containing 0.1wt% of the active ingredient is obtained.
- VI. An intimate mixture of 3 parts by weight of compound no. 1 and 97 parts by weight of particulate kaolin. The dust contains  
35 3wt% of the active ingredient.
- VII. An intimate mixture of 30 parts by weight of compound no. 4, 92 parts by weight of powdered silica gel and 8 parts by weight of paraffin oil sprayed onto the surface of this silica  
40 gel. This formulation of the active ingredient exhibits good adherence.
- VIII. A stable aqueous dispersion of 40 parts by weight of compound no. 2, 10 parts of the sodium salt of a phenolsulfonic  
45 acid-urea-formaldehyde condensate, 2 parts of silica gel and 48 parts of water, which dispersion can be further diluted.

2106497

38

IX. A stable oily dispersion of 20 parts by weight of compound no. 3, 2 parts by weight of the calcium salt of dodecylbenzenesulfonic acid, 8 parts by weight of a fatty alcohol polyglycol ether, 2 parts by weight of the sodium salt of a phenolsulfonic acid-urea-formaldehyde condensate and 68 parts by weight of a paraffinic mineral oil.

X. A hammer-milled mixture of 10 parts by weight of compound no. 1, 4 parts by weight of the sodium salt of diisobutyl naphthalene- $\alpha$ -sulfonic acid, 20 parts by weight of the sodium salt of a lignin-sulfonic acid obtained from a sulfite waste liquor, 38 parts by weight of silica gel, and 38 parts by weight of kaolin. By finely dispersing the mixture in 10,000 parts by weight of water, a spray liquor containing 0.1wt% of the active ingredient is obtained.

Used alone, the active ingredients act as low-foaming biocides. A significant increase in the action of biocidal formulations containing these compounds is achieved if tri-C<sub>6</sub>- to C<sub>12</sub>-alkylmethylammonium salts, preferably in amounts of from 20 to 40wt%, based on the weight of compounds of the general formula I, are added.

The active ingredients may also be mixed with other, prior art, microbicides. In many instances, a synergistic effect is achieved, i.e., the microbicidal action of the mixture is greater than the added actions of its individual components.

Prior art microbicides may be added to the novel substances in a weight ratio of from 1:100 to 100:1.

30

- 15 Synthesis examples

The directions given in the synthesis examples below were used, after appropriate modification of the starting materials, to obtain further compounds I. The compounds thus obtained are listed in the tables below with their physical data.

1. N-hydroxy-N-(2-propylphenyl)-2-chloronicotinamide

- At 0°C, 14 ml of water and 19.6 g of sodium bicarbonate are added to a solution of 15.1 g of 2-n-propylphenylhydroxylamine in 75 ml of a 2:1 mixture of ether and ligroin, and 13.6 g of 2-chloronicotinamide is then dripped in while stirring vigorously. The mixture is stirred overnight at room temperature and then suction filtered. The residue is stirred for 15 minutes in 10% strength sodium bicarbonate solution, suction filtered, dissolved in ethyl acetate and dried, and the solvent is evaporated off under reduced pressure. From the crude product (14.6 g) there is isolated, after recrystallization from ethanol, 12.5 g of 2-chloro-nicotinic acid-N-hydroxy-2-n-propylanilide of m.p. 134-135°C.

Examples demonstrating biological action:

#### Action on Botrytis cinerea

25

Slices of green paprika pods were sprayed to runoff with aqueous suspensions containing (dry basis) 80% of the active ingredient and 20% of emulsifier. After the sprayed-on layer had dried, the slices were sprayed with a spore suspension [1.7·10<sup>6</sup> spores per ml; 2% biomalt; water] of the fungus *Botrytis cinerea* and then kept for 4 days at 18°C and in high humidity.

30

After this period, the untreated controls exhibited 90% fungus attack, whereas the paprika slices treated with 500 ppm of compounds nos. 1 and 2 exhibited 5% attack at most.

35

At an application rate of 1000 ppm of compounds nos. 1 and 2 the paprika slices exhibited no attack at all, whereas the slices treated with 1000 ppm of 2-chloronicotinic acid-2-chloroanilide exhibited 90% attack, just as the untreated controls.
